## INDOLE DERIVATIVES

The present invention relates to indole derivatives, to pharmaceutical compositions comprising the same and to the use of these indole derivatives in therapy, especially in the treatment of pain.

- Pain treatment is often limited by the side effects of currently available medication. For moderate to severe pain, opioids are widely used. These agents are cheap and effective but suffer from serious and potentially life-threatening side effects, most notably respiratory depression and muscle rigidity. In addition, the doses of opioids which can be administered are limited by nausea, emesis, constipation, pruritis and urinary retention, often resulting in patients electing to receive sub-optimal pain control rather than suffer these distressing side effects. Opioids are highly addictive and are scheduled drugs in many territories. There is therefore a demand for new analgesics that have an improved side effect profile compared to opioids, at equi-analgesic doses. Current treatments for neuropathic pain, including opioids, tricyclic antidepressants, serotonin and noradrenaline uptake inhibitors and anticonvulsants are of limited efficacy. There is therefore a demand for new analgesics that have improved efficacy for the treatment of neuropathic pain.
- Evidence is accumulating that cannabinoid agonists have potential as analgesic and anti-inflammatory agents. Two types of cannabinoid receptors are implicated, the cannabinoid CB1 receptor, which is located primarily in the central nervous system but which is also expressed by peripheral neurones and to a lower extent in other peripheral tissues, and the cannabinoid CB2 receptor, which is mostly located in immune cells (Howlett, A. C. et al.: International Union of Pharmacology. XXVII. Classification of Cannabinoid Receptors. *Pharmacol. Rev.* **54**, 161-202, 2002). While the CB2 receptor has been implicated in modulating the immune and anti-inflammatory response of cannabinoids, cannabinoid receptor agonists, especially those acting at the CB1 receptor have been suggested as useful in the treatment of pain (see Iversen, L. and Chapman, V. *Current Opinion in Pharmacology*, **2**, 50-55, 2002 and references therein).
- WIN 55,212-2, the mesylate salt of (*R*)-(+)-[2,3-dihydro-5-methyl-[*(morpholinyl)methyl*]pyrrolo[1,2,3-*de*]-1,4-benzoxazinyl]-[1-naphthalenyl]methanone was disclosed in US Patent 4,939,138 (Sterling Drug Inc.) as an analgesic agent. The compound is the prototype of aminoalkylindoles (Eissenstat, M.A. et al., *J. Med. Chem.* **38**, 3094-3105, 1995), which are potent cannabinoid CB1 receptor agonists that can produce antinociception with equivalent efficacy to morphine in animal models of acute pain, persistent inflammatory pain and neuropathic pain.

Key structural features of aminoalkylindoles having cannabimimetic properties (Adam, J. and Cowley, P. *Expert Opin. Ther. Patents*, **12**, 1475-1489, 2002) are an aminoalkyl substituent at the 1-position of the indole moiety, and a further bulky substituent in the 3-position of the indole ring, such as exemplified by an aroyl group in the aminoalkylindoles disclosed in US

- 5 Patent 4,939,138 (Sterling Drug Inc.) and in the more recent WO02060447 ((University of Connecticut), or by a substituted amido-group in the compounds disclosed in WO0158869 (Bristol-Myers Squibb). 1-(Aminoalkyl)indole derivatives having a substituted oxadiazol-5-yl ring at the 3-position were disclosed in WO0236590 (Amrad Operations PTY Ltd.) as cannabinoid receptor modulators and useful as analgesic agents.
- 10 In WO2004000832, WO2005058327 and WO2005089754 (Akzo Nobel N.V.), 1-[(indol-3-yl)carbonyl]piperazine derivatives and 1-(indol-3-yl) heterocycle derivatives are disclosed as analgesic agents which modulate the cannabinoid receptor.
- There remains a need for cannabinoid agonists with improved properties, such as increased water solubility, for use as therapeutic agents.

15 The indole derivatives of the invention are distinguished from the (indol-3-yl)-heterocycle derivatives disclosed in WO2005089754 (Akzo Nobel N.V.) by the presence of the (homo)piperazine moiety.

The 5-membered aromatic heterocyclic ring A, as used in the definition of Formula I,

20 represents a 5-membered aromatic heterocyclic ring, which contains 1-3 heteroatoms selected from N, O and S. This means that at least one of X<sub>1</sub>, X<sub>2</sub> and X<sub>3</sub>, used to define heterocycle A, cannot be CH. Representative heterocycles A are those derived from thiophene, furan, thiazole, thiadiazole, oxazole, oxadiazole and their isomers including isothiazole, isothiadiazole, isoxazole and isoxadiazole. Preferred heterocycles A are 1,2,4-oxadiazole (X<sub>1</sub> is N, X<sub>2</sub> is O, X<sub>3</sub> is N) and 1,2,4-thiadiazole (X<sub>1</sub> is N, X<sub>2</sub> is S, X<sub>3</sub> is N).

The term (C<sub>1-4</sub>)alkyl as used in the definition of Formula I means a branched or unbranched alkyl group having 1-4 carbon atoms, like butyl, isobutyl, tertiary butyl, propyl, isopropyl, ethyl and methyl.

30 The term (C<sub>1-6</sub>)alkyl likewise means a branched or unbranched alkyl group having 1-6 carbon atoms, like hexyl, pentyl, butyl, isobutyl, tertiary butyl, propyl, isopropyl, ethyl and methyl.

The term (C<sub>3-7</sub>)cycloalkyl means a cycloalkyl group having 3-7 carbon atoms, like cycloheptyl, cyclohexyl, cyclopentyl, cyclobutyl and cyclopropyl.

In the term (C<sub>1-4</sub>)alkyloxy, (C<sub>1-4</sub>)alkyl has the meaning as defined above.

35 The term halogen means F, Cl, Br or I.

The term n can represent the integer 1 or 2, thereby defining piperazine and homopiperazine derivatives of Formula I, respectively. Preferred indole derivatives of the invention are those wherein n is 1.

Indole derivatives of Formula I wherein R<sub>2</sub> and R<sub>5</sub> together represent a methylene or an

- 5 ethylene bridge, comprise a bridged piperazine or homopiperazine group, such as for example a 2,5-diazabicyclo[2.2.2]octan-2-yl or a 2,5-diazabicyclo[2.2.1]heptan-2-yl group. There is a preference for indole derivatives according to Formula I, wherein Y is O or SO<sub>2</sub>. Further preferred are the compounds wherein R<sub>6</sub> is (C<sub>1-4</sub>)alkyl, substituted with CO-NR<sub>9</sub>R<sub>10</sub> or 1,2,4-oxadiazol-3-yl.

- 10 Specifically preferred indole derivatives of the invention are:

- 3-((5-[4-(carbamoylmethyl)piperazin-1-yl]methyl)-[1,2,4]-thiadiazol-3-yl)-7-chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole;

- 3-((5-[4-(carbamoylmethyl)piperazin-1-yl]methyl)-[1,2,4]-thiadiazol-3-yl)-7-methoxy-1-(tetrahydropyran-4-yl)methyl-1*H*-indole;
- 3-((5-[4-(carbamoylmethyl)piperazin-1-yl]methyl)-[1,2,4]-thiadiazol-3-yl)-7-chloro-1-(1-dioxo-hexahydrothiopyran-4-yl)methyl-1*H*-indole;

- 3-((4-[4-(carbamoylmethyl)piperazin-1-yl]methyl)-[1,3]-thiazol-2-yl)-7-chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole, or a pharmaceutically acceptable salt thereof.

The indole derivatives of the invention may be prepared by methods known in the art of organic chemistry in general.

Indole derivatives of Formula I can for instance be prepared from compounds of Formula II where L is a leaving group, such as a halogen or an alkylsulfonate group, by nucleophilic

- 5 displacement of the leaving group with an optionally substituted piperazine or homopiperazine of formula

wherein n, R<sub>2</sub>, R<sub>2'</sub>, R<sub>3</sub>, R<sub>3'</sub>, R<sub>4</sub>, R<sub>4'</sub>, R<sub>5</sub>, R<sub>5'</sub> and R<sub>6</sub> have the meaning as previously defined.

Compounds of Formula II where L is an alkylsulfonate group can be prepared from

- 10 compounds of Formula II where L is hydroxy, by reaction with an alkylsulfonyl halide in the presence of a base such as triethylamine.

Indole derivatives of Formula I can be prepared from compounds of Formula III by reductive amination, using an optionally substituted piperazine or homopiperazine in the presence of a reducing agent such as sodium triacetoxylborohydride.

- 15 It is well known in the art that compounds of Formula II where L is hydroxy can be interconverted with compounds of Formula III, by oxidation and reduction using suitable oxidising and reducing agents, as described in Burke D.S., Danheiser, R.L. *Handbook of Reagents for Organic Synthesis: Oxidising and Reducing agents* (Wiley: New York, 1999). Likewise, compounds of Formula II where L is hydroxy can be prepared from compounds of Formula IV
- 20 where R<sub>15</sub> is hydrogen or (C<sub>1-4</sub>)alkyl, by reduction using suitable reducing agents.

Formula II

Formula III

Formula IV

Compounds of Formula I, Formula II, Formula III or Formula IV can be prepared from compounds of Formula V to Formula XII inclusive, using methods well known in the art for constructing heterocyclic rings. Such methods are described in the general reference

Katritzky, A.R.: *Comprehensive heterocyclic chemistry* (First Edition, Pergamon Press, 1984, see especially Volume 4, Part 3, *Five-membered rings with one oxygen, sulfur or nitrogen atom* and Volume 6, Part 4B, *Five-membered rings with two or more oxygen, sulfur or nitrogen atoms*).

- 10 10 For example, compounds of Formula VI can be prepared from compounds of Formula V, or activated derivatives thereof, by reaction with ammonia in a suitable solvent. Compounds of Formula VII can be prepared from compounds of Formula VI using thionation reagents, such as phosphorus pentasulfide or Lawesson's reagent. Alternatively, compounds of Formula VII can be prepared from compounds of Formula VIII by reaction with
- 15 15 thioacetamide in a solvent such as dimethylformamide. Compounds of Formula VIII can be prepared from compounds of Formula VI by dehydration, for example using trifluoroacetic anhydride in the presence of a base such as triethylamine. Compounds of Formula X can be prepared from compounds of Formula IX by reaction with hydroxylamine in a suitable solvent.
- 20 20 Compounds of Formula XI where L is NH<sub>2</sub> can be prepared from compounds of Formula V, or activated derivatives thereof, by reaction with cyanide anion to form an oxoacetonitrile,

followed by reduction of the nitrile to a primary amine using a reducing agent, such as hydrogen gas in the presence of a catalyst such as palladium on charcoal.

Compounds of Formula XII can be prepared from compounds of Formula VIII by reaction with hydroxylamine in a suitable solvent.

- 5 Compounds of Formula V and compounds of Formula XI can be prepared by acylation of compounds of Formula XIII. For example, compounds of Formula V where R<sub>15</sub> is hydrogen can be prepared by acylation of compounds of Formula XIII using trifluoroacetic anhydride in a solvent such as dimethylformamide, followed by hydrolysis using aqueous sodium hydroxide at an elevated temperature. Compounds of Formula XI where L is chlorine can be

- Compounds of Formula IX can be prepared from compounds of Formula XIII by formylation, for example using the Vilsmeier reaction (for a review see Jutz, C. *Adv. Org. Chem.* 9, pt. 1, 225-342, 1976).
- 15 Alternatively, compounds of Formula V can be prepared from compounds of Formula XIV using procedures described by Wijngaarden *et al.*, (*J. Med. Chem.* 36, 3693-3699, 1993) or Hwu *et al.*, (*J. Org. Chem.* 59, 1577-1582, 1994) or modifications of these procedures.

Formula XIII

Formula XIV

Formula XV

Formula XVI

Compounds of Formula XIII can be prepared by literature procedures or modifications of

- 20 literature procedures known to those persons skilled in the art. For example, compounds of Formula XIII can be prepared by alkylation of compounds of Formula XV, by treatment with a base such as sodium hydride, followed by reaction with an alkylating agent of Formula XVI, where Y has the meaning as defined before and L is a leaving group, such as a halogen or alkylsulfonate group. Compounds of Formula XV can be obtained from commercial sources,
- 25 prepared by literature procedures or modifications of literature procedures known to those persons skilled in the art.

Alternatively, compounds of Formula XIII can be prepared from compounds of Formula XIV using the Fischer indole synthesis or modifications thereof (*Chem. Rev.* 69, 227-250, 1969).

- Compounds of Formula XIV can be prepared by literature procedures or modifications of
- 30 literature procedures known to those persons skilled in the art.
- Compounds of Formula I, Formula II, Formula III or Formula IV may alternatively be prepared from compounds of Formula XVII using transition metal catalysed coupling reactions, as

described in the general reference Hegedus, L.S. *Transition Metals in the Synthesis of Complex Organic Molecules* (Second Edition, University Science: Sausalito 1999).

For example, compounds of Formula III may be prepared by the reaction of compounds of Formula XVII, where Y<sub>1</sub> is halogen, with compounds of Formula XVIII, where Y<sub>2</sub> is a boronic acid or a boronic acid ester, using a Suzuki reaction (*Chem. Rev.* **95**, 2457-2483, 1995) or a modification thereof.

Formula XVII

Formula XVIII

Compounds of Formula XVII and compounds of Formula XVIII can be obtained from commercial sources, prepared by literature procedures or modifications of literature

procedures known to those persons skilled in the art. For example, compounds of Formula XVII where Y<sub>1</sub> is bromine may be prepared by bromination of a compound of Formula XIII using bromine in a solvent such as dimethylformamide.

It will be appreciated by those persons skilled in the art that the indole nitrogen may be temporarily protected during the transformations described above using a protecting group,

such as an arylsulfonyl group, to be deprotected and alkylated at a later stage in the synthesis. It will further be appreciated that such protecting groups may be used to modify the stability of intermediates and the reactivity of the indole ring towards electrophiles.

Suitable protecting groups are described in Kocienski, P.J.: *Protecting Groups*, Thieme, Stuttgart; New York, 1994.

20

The skilled person will likewise appreciate that various indole derivatives of Formula I can be obtained by appropriate conversion reactions of functional groups corresponding to certain of the substituents R<sub>2</sub>-R<sub>6</sub>.

For example, compounds of Formula I wherein R<sub>6</sub> is (C<sub>1-4</sub>)alkyl (optionally substituted with

OH, (C<sub>1-4</sub>)alkyloxy, CO-NR<sub>9</sub>R<sub>10</sub>, CO-OR<sub>11</sub> or 1,2,4-oxadiazol-3-yl), can be prepared by reaction of a compound of Formula I where R<sub>6</sub> is hydrogen with a (C<sub>1-4</sub>)alkyl halide or a functionalised (C<sub>1-4</sub>)alkyl halide, in the presence of a base such as potassium carbonate.

Compounds of Formula I wherein R<sub>6</sub> is SO<sub>2</sub>NR<sub>12</sub>R<sub>13</sub> can be prepared by reaction of a compound of Formula I where R<sub>6</sub> is hydrogen with a sulfamide or a functionalised sulfamoyl

chloride, in the presence of a base such as pyridine. Compounds of Formula I wherein R<sub>2</sub>, R<sub>3</sub>, R<sub>3</sub>', R<sub>4</sub>, R<sub>4</sub>', R<sub>5</sub> or R<sub>5</sub>' is CH<sub>2</sub>OH can be prepared from compounds of Formula I

wherein R<sub>2</sub>, R<sub>2'</sub>, R<sub>3</sub>, R<sub>3'</sub>, R<sub>4</sub>, R<sub>4'</sub>, R<sub>5</sub> or R<sub>5'</sub> is CO-OR<sub>8</sub> by reduction using a suitable reducing agent.

The indole derivatives of Formula I and their salts may contain at least one centre of chirality,

- 5 and exist therefore as stereoisomers, including enantiomers and diastereomers. The present invention includes the aforementioned stereoisomers within its scope and each of the individual R and S enantiomers of the compounds of Formula I and their salts, substantially free, i.e. associated with less than 5%, preferably less than 2%, in particular less than 1% of the other enantiomer, and mixtures of such enantiomers in any proportions including the 10 racemic mixtures containing substantially equal amounts of the two enantiomers.

Methods for asymmetric synthesis or chiral separation whereby the pure stereoisomers are obtained are well known in the art, e.g. synthesis with chiral induction or starting from commercially available chiral substrates, or separation of stereoisomers, for example using chromatography on chiral media or by crystallisation with a chiral counter-ion.

- 15 Pharmaceutically acceptable salts may be obtained by treating a free base of a compound of Formula I with a mineral acid such as hydrochloric acid, hydrobromic acid, phosphoric acid and sulfuric acid, or an organic acid such as for example ascorbic acid, citric acid, tartaric acid, lactic acid, maleic acid, malonic acid, fumaric acid, glycolic acid, succinic acid, propionic acid, acetic acid and methane sulfonic acid.

The compounds of the invention may exist in unsolvated as well as in solvated forms with pharmaceutically acceptable solvents such as water, ethanol and the like. In general, the solvated forms are considered equivalent to the unsolvated forms for the purpose of the 25 invention.

The present invention further provides pharmaceutical compositions comprising an indole derivative according to general Formula I, or a pharmaceutically acceptable salt thereof, in admixture with pharmaceutically acceptable auxiliaries, and optionally other therapeutic

- 30 agents. The term "acceptable" means being compatible with the other ingredients of the composition and not deleterious to the recipients thereof. Compositions include e.g. those suitable for oral, sublingual, subcutaneous, intravenous, epidural, intrathecal, intramuscular, transdermal, pulmonary, local, or rectal administration, and the like, all in unit dosage forms for administration. A preferred route of administration is the oral route.

For oral administration, the active ingredient may be presented as discrete units, such as tablets, capsules, powders, granulates, solutions, suspensions, and the like.

For parenteral administration, the pharmaceutical composition of the invention may be presented in unit-dose or multi-dose containers, e.g. injection liquids in predetermined amounts,

5 for example in sealed vials and ampoules, and may also be stored in a freeze dried (lyophilized) condition requiring only the addition of sterile liquid carrier, e.g. water, prior to use.

Mixed with such pharmaceutically acceptable auxiliaries, e.g. as described in the standard reference, Gennaro, A.R. et al, Remington: *The Science and Practice of Pharmacy* (20th Edition, Lippincott Williams & Wilkins, 2000, see especially Part 5: Pharmaceutical

10 Manufacturing), the active agent may be compressed into solid dosage units, such as pills, tablets, or be processed into capsules, suppositories or patches. By means of pharmaceutically acceptable liquids the active agent can be applied as a fluid composition, e.g. as an injection preparation, in the form of a solution, suspension, emulsion, or as a spray, e.g. a nasal spray.

15 For making solid dosage units, the use of conventional additives such as fillers, colorants, polymeric binders and the like is contemplated. In general any pharmaceutically acceptable additive which does not interfere with the function of the active compounds can be used.

Suitable carriers with which the active agent of the invention can be administered as solid compositions include lactose, starch, cellulose derivatives and the like, or mixtures thereof,

20 used in suitable amounts. For parenteral administration, aqueous suspensions, isotonic saline solutions and sterile injectable solutions may be used, containing pharmaceutically acceptable dispersing agents and/or wetting agents, such as propylene glycol or butylene glycol.

The invention further includes a pharmaceutical composition, as hereinbefore described, in

25 combination with packaging material suitable for said composition, said packaging material including instructions for the use of the composition for the use as hereinbefore described.

The indole derivatives of the invention were found to be agonists of the CB1 receptor, as determined in a human CB1 reporter assay using CHO cells. Methods to determine receptor

30 binding as well as *in vitro* biological activity of cannabinoid receptor modulators are well known in the art. In general, expressed receptor is contacted with the compound to be tested and binding or stimulation or inhibition of a functional response is measured.

To measure a functional response isolated DNA encoding the CB1 receptor gene, preferably the human receptor, is expressed in suitable host cells. Such a cell might be the Chinese

35 Hamster Ovary cell, but other cells are also suitable. Preferably the cells are of mammalian origin.

Methods to construct recombinant CB1 expressing cell lines are well known in the art (Sambrook *et al*, Molecular Cloning: a Laboratory Manual, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, latest edition). Expression of the receptor is attained by expression of the DNA encoding the desired protein. Techniques for ligation of additional

- 5 sequences and construction of suitable expression systems are all, by now, well known in the art. Portions or all of the DNA encoding the desired protein can be constructed synthetically using standard solid phase techniques, preferably to include restriction sites for ease of ligation. Suitable control elements for transcription and translation of the included coding sequence can be provided to the DNA coding sequences. As is well known, expression  
10 systems are now available which are compatible with a wide variety of hosts, including prokaryotic hosts such as bacteria and eukaryotic hosts such as yeast, plant cells, insect cells, mammalian cells, avian cells and the like.

Cells expressing the receptor are then contacted with the test compound to observe binding, or stimulation or inhibition of a functional response.

- 15 Alternatively isolated cell membranes containing the expressed CB1 (or CB2) receptor may be used to measure binding of compound.

For measurement of binding radioactively or fluorescently labelled compounds may be used. The most widely used radiolabelled cannabinoid probe is [<sup>3</sup>H]CP55940, which has approximately equal affinity for CB1 and CB2 binding sites.

- 20 Functional CB1 receptor agonist activity may be measured by determining the second messenger response, such as for example measurement of receptor mediated changes in cAMP or MAPkinase pathways. Thus, such a method involves expression of the CB1 receptor on the cell surface of a host cell and exposing the cell to the test compound. The second messenger response is then measured. The level of second messenger will be  
25 reduced or increased, depending on the effect of the test compound upon binding to the receptor.

In addition to direct measurement of e.g. cAMP levels in the exposed cell, cells can be used which in addition to transfection with receptor encoding DNA are also transfected with a second DNA encoding a reporter gene, the expression of which correlates with receptor activation. In general, reporter gene expression might be controlled by any response element reacting to changing levels of second messenger. Suitable reporter genes are e.g. LacZ, alkaline phosphatase, firefly luciferase and green fluorescence protein. The principles of such transactivation assays are well known in the art and are described e.g. in Stratowa, C.A. et

al., *Curr. Opin. Biotechnol.* **6**, 574 (1995). For selecting active agonist compounds on the CB1 receptor the EC<sub>50</sub> value must be < 10<sup>-5</sup> M, preferably < 10<sup>-7</sup> M.

The compounds may be used as analgesic agents in the treatment of pain such as for example peri-operative pain, chronic pain, neuropathic pain, cancer pain and pain and

5 spasticity associated with multiple sclerosis.

Cannabinoid agonists of the invention would also potentially be useful in the treatment of other disorders including multiple sclerosis, spasticity, inflammation, glaucoma, nausea and emesis, loss of appetite, sleep disturbances, respiratory disorders, allergies, epilepsy,

migraine, cardiovascular disorders, neurodegenerative disorders, anxiety, traumatic brain

10 injury and stroke.

The compounds could also be used in conjunction with other drugs, for example analgesic drugs such as opioids and non-steroidal anti-inflammatory drugs (NSAIDs), including COX-2 selective inhibitors.

15 The compounds of the invention may be administered to humans in a sufficient amount and for a sufficient amount of time to alleviate the symptoms. Illustratively, dosage levels for humans can be in the range of 0.001-50 mg per kg body weight, preferably in a dosage of 0.01-20 mg per kg body weight.

**Preparation of intermediates.****I: Toluene-4-sulfonic acid tetrahydropyran-4-ylmethyl ester intermediate**

*p*-Toluenesulfonyl chloride (29.8 g, 157 mmol) was added portionwise to a mixture of tetrahydro-2*H*-pyran-4-yl-methanol (20.0 g, 172 mmol) and pyridine (25.2 ml, 313 mmol) in dichloromethane (200 ml). The mixture was stirred at room temperature for 17 h, then quenched with aqueous hydrochloric acid (2 M; 100 ml). The layers were separated and the aqueous layer extracted 2x with dichloromethane (2x100 ml). The organic layers were combined and concentrated *in vacuo*. Recrystallisation from dichloromethane:n-heptane (5:1) afforded toluene-4-sulfonic acid tetrahydro-pyran-4-ylmethyl ester. The mother liquors were further purified by silica gel column chromatography eluting with 50% dichloromethane in n-heptane to yield a further quantity of toluene-4-sulfonic acid tetrahydropyran-4-ylmethyl ester (total yield 41.6 g, 154 mmol).

**II: Toluene-4-sulfonic acid 1,1-dioxo-hexahydro-1-thiopyran-4-ylmethyl ester intermediate****Step A: Tetrahydro-thiopyran-4-carbonitrile**

A mixture of tetrahydro-thiopyran-4-one (75 g, 646 mmol) and toluenesulfonylmethyl isocyanide (138.6 g, 710 mmol) in dimethoxyethane (2.5 L) was cooled to 0 °C and a solution of potassium tert-butoxide (145 g, 1.29 mol) in tert-butanol (1.3 L) added dropwise. The mixture was then allowed to warm to room temperature and stirred for 3 h before dilution with diethyl ether (3 L), washing with saturated sodium bicarbonate (2 x 1.5 L) and drying over magnesium sulfate. Removal of the solvent *in vacuo* gave tetrahydro-thiopyran-4-carbonitrile as a pale brown oil (88.3 g, 646 mmol).

**Step B: Tetrahydro-thiopyran-4-carboxylic acid**

A solution of tetrahydro-thiopyran-4-carbonitrile (646 mmol) in ethanol (600 ml) was added in one portion to a rapidly stirring mixture of sodium hydroxide (258.4 g, 6.46 mol) in water (1.1 L). The mixture was then heated to 90 °C for 2 h, cooled to 0 °C and the pH adjusted to 2 with conc. hydrochloric acid solution. The ethanol was then removed *in vacuo* and the suspension extracted into dichloromethane (3 x 1 L). The combined organic extracts were then dried over magnesium sulfate and evaporated *in vacuo* to give tetrahydro-thiopyran-4-carboxylic acid as a brown solid (96 g, 646 mmol).

**Step C : (Tetrahydro-thiopyran-4-yl)-methanol**

A solution of borane dimethylsulfide complex (73.5 ml, 775 mmol) in anhydrous tetrahydrofuran (1.5 L) was treated dropwise over 15 min with a solution of tetrahydro-thiopyran-4-carboxylic acid (646 mmol) in anhydrous tetrahydrofuran (300 ml). The mixture was then heated to 70 °C for 2 h, cooled to room temperature and quenched by dropwise addition of water until effervescence ceased. A further portion of water (500 ml) was then

added and the tetrahydrofuran removed *in vacuo*. The residue was then acidified with dilute hydrochloric acid solution and extracted into dichloromethane (3 x 500 ml). The combined organic layers were then dried over sodium sulfate and the solvent removed *in vacuo* to give (tetrahydro-thiopyran-4-yl)-methanol as a brown oil (90.2 g, 646 mmol).

5 **Step D:** (1,1-Dioxo-hexahydro-1-thiopyran-4-yl)-methanol

A solution of sodium periodate (304 g, 1.42 mol) in water (3 L) was treated with a solution of (tetrahydro-thiopyran-4-yl)-methanol in methanol (1.7 L) and the mixture heated to 60 °C for 3 h. Sodium periodate (10 g) was then added and heating continued for a further 1 h before removal of all volatiles *in vacuo*. The resulting granular residue was then shaken with successive portions of diethyl ether (2 x 500 ml), dichloromethane (2 x 500 ml) and 50% (v/v) dichloromethane in methanol (2 x 500 ml). The remaining residue was then treated to a continuous extraction using dichloromethane for 18 h and the solvent combined with the earlier solvent extractions, dried over sodium sulfate and evaporated *in vacuo* to give (1,1-dioxo-hexahydro-1-thiopyran-4-yl)-methanol as an orange oil (106.2 g, 646 mmol) which crystallised on standing.

15 **Step E:** Toluene-4-sulfonic acid 1,1-dioxo-hexahydro-1-thiopyran-4-ylmethyl ester

A solution of (1,1-dioxo-hexahydro-1-thiopyran-4-yl)-methanol (105 g, 640 mmol), pyridine (155 ml, 1.92 mol) and 4-dimethylaminopyridine (2.5 g, 20.5 mmol) in chloroform (1.5 L) was treated portionwise with *p*-toluenesulfonyl chloride (244 g, 1.28 mol) over 15 mins. The mixture was stirred for 72 h, washed with water (2 x 1 L), saturated sodium chloride solution (1 L) and dried over sodium sulfate. The organic solvent was removed *in vacuo* and the oily residue shaken with 60% (v/v) *n*-heptane in ethyl acetate to give a brown solid on filtration. This was dissolved in the minimum dichloromethane, passed through a celite pad eluting with ethyl acetate (4 L). The solvent was then removed *in vacuo* until the solution volume was 750 ml and *n*-heptane (1.5 L) added. The resulting suspension was then filtered to give the title compound as a sandy solid (130 g, 408 mmol). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): 1.80-2.00 (3H, m), 2.07-2.15 (2H, m), 2.46 (3H, s), 2.90-3.09 (4H, m), 3.90 (2H, d, *J* 6.3), 7.36 (2H, d, *J* 8.1) and 7.78 (2H, d, *J* 8.2).

**3-[(5-[4-(Carbamoylmethyl)piperazin-1-yl)methyl]-[1,2,4]oxadiazol-3-yl]-7-chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole, hydrochloride salt**

10 **Step A: 7-Chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole-3-carbonitrile**

Phosphorus oxychloride (9.6 ml, 103 mmol) was added dropwise, via a pressure equalising funnel, to a cooled (5–10 °C) solution of 7-chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole-3-carboxylic acid amide (20.0 g, 68.3 mmol) in dimethylformamide (200 ml).

Following complete addition of phosphorus oxychloride the reaction was left to stir for 10  
15 mins before warming to room temperature and allowing to stir for a further 30 mins. The reaction mixture was then poured carefully into ice cold water (2000 ml), the resulting precipitate filtered off and washed with water. The filter cake was then dissolved in dichloromethane, washed with water and brine, dried over sodium sulfate and the solvent removed *in vacuo*. The resulting solid was crystallised from diethyl ether to yield 7-chloro-1-(tetrahydro-  
20 pyran-4-yl)methyl-1*H*-indole-3-carbonitrile (12.9 g, 46.9 mmol) as a white solid.

**Step B: 7-Chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole-3-carboxamidine**

To a suspension of 7-chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole-3-carbonitrile (12.9 g, 46.9 mmol) in ethanol (280 ml) and *N,N*-diisopropylethylamine (16.7 ml, 96.0 mmol) was added hydroxylamine hydrochloride (6.8 g, 121.4 mmol). The reaction mixture was  
25 warmed to reflux and stirred for 6 h before cooling to room temperature and the solvent removed *in vacuo*. The solid was dissolved in dichloromethane, washed with water and brine, dried over sodium sulfate and the solvent removed *in vacuo*. The resulting solid was crystallised from diethyl ether to yield 7-chloro-1-(tetrahydropyran-4-yl)methyl-1*H*-indole-3-carboxamidine (13.1 g, 42.5 mmol) as an off white solid.

30 **Step C: 7-Chloro-3-[(5-chloromethyl)-[1,2,4]oxadiazol-3-yl]-1-(tetrahydropyran-4-yl)methyl-1*H*-indole**

Molecular sieves (5.3 g) were added to a stirred solution of 7-chloro-1-(tetrahydro-  
pyran-4-yl)methyl-1*H*-indole-3-carboxamidine (5.3 g, 17.2 mmol) in tetrahydrofuran (150 ml) and the reaction mixture was stirred for 60 mins. Sodium hydride (2.8 g, 116.6 mmol) was  
35 added portionwise and the reaction mixture allowed to stir for a further 60 mins before warming to 40 °C for 30 mins. The reaction was then cooled to -70 °C (dry ice/acetone bath)

before the addition of chloroacetyl chloride (2.8 ml, 35.2 mmol) dropwise, via a pressure equalising funnel. The reaction was then allowed to warm to room temperature and stirred for a further 4 h before being quenched by the addition of water (5 ml), filtered and the solvent removed *in vacuo*. The solid was dissolved in dichloromethane, washed with water

5 and brine, dried over sodium sulfate and the solvent removed *in vacuo*. The resulting residue was purified by flash column chromatography eluting with 1% (v/v) ethanol in dichloromethane through to 3% (v/v) ethanol in dichloromethane. The product containing fractions were combined, solvent removed *in vacuo*, and the resultant solid recrystallised from diethyl ether to yield 7-chloro-3-[(5-chloromethyl)-[1,2,4]oxadiazol-3-yl]-1-(tetrahydro-  
10 pyran-4-yl)methyl-1*H*-indole (4.1 g, 11.2 mmol) as a white solid.

To a solution of 7-chloro-3-[(5-chloromethyl)-[1,2,4]-oxadiazol-3-yl]-1-(tetrahydro-pyran-4-yl)methyl-1*H*-indole (50 mg, 0.14 mmol) in 1-methyl-2-pyrrolidinone (1 ml) was added 2-piperazin-1-ylacetamide (40 mg, 0.28 mmol) and potassium carbonate (28 mg, 0.20 mmol). The reaction was stirred at room temperature for 18 h. The reaction was diluted with dichloromethane (1 ml) and filtered through a 2 g Strata™ SCX giga tube. The tube was washed with methanol and then eluted with 2 M ammonia in methanol. The methanolic ammonia solution was evaporated and the residue purified by flash column chromatography, eluting with 0% to 8% (v/v) ethanol in dichloromethane. The purified product was dissolved in dichloromethane and hydrogen chloride (2M solution in diethyl ether; 0.2 ml, 0.4 mmol) was added. The hydrochloride salt was precipitated by addition of ethanol and diethyl ether and filtered off to afford the title compound (10 mg, 0.02 mmol). EsIMS: m/z 475.1, 473.1 [M+H]<sup>+</sup>.

### Example 32

20 In-vitro determination of efficacy and potency at the human CB1 receptor expressed in CHO cells

Chinese Hamster Ovary (CHO) cells expressing the human CB1 receptor and a luciferase reporter gene were suspended in phenol red/serum free DMEM/F-12 nut mix containing penicillin/streptomycin (50U/50 µg/ml) and fungizone (1 µg/ml) and seeded into 96 well plates  
25 at a density of  $3 \times 10^4$  cells per well (100 µl final volume). Cells were incubated overnight (approx. 18 h at 37 °C, 5% CO<sub>2</sub>/95% air) prior to assay.

The test compound (10 mM solution in dimethylsulfoxide) was diluted in F12 Nut Mix to give a range of stock solutions from 0.11 mM to 0.11 nM. The stock solutions (10 µl) were added directly to the relevant wells. The plates were incubated at 37 °C for 5 h to allow agonist-  
30 induced expression of the luciferase enzyme. Under subdued light, LucLite substrate (Packard; reconstituted as per manufacturer's instructions; 100 µl) was added to each well. Plates were covered with Top Seal and then incubated at room temperature for 5 minutes before counting on the Packard TopCount (single photon counting, 0.01 minute count time, 5 minute count delay).

A "best-fit" curve was fitted by a minimum sum of squares method to the plot of counts per second (CPS) against compound concentration (M) to obtain an EC<sub>50</sub> value. Table 1 shows the pEC<sub>50</sub> values obtained for some representative compounds of the invention.

**Example 33.****The rat (Chung) model of neuropathic pain.**

In this model, mechanical allodynia is induced by tight ligation of the left L5 spinal nerve. This assay has been employed successfully to demonstrate anti-allodynic effects of 5 anticonvulsants (gabapentin), antidepressants (duloxetine) and opioid analgesics (morphine) which are used clinically in the treatment of neuropathic pain.

Male Wistar rats (150–175 g body weight at time of surgery) were employed in the study. Rats were placed on an elevated (~40cm) mesh floor in perspex boxes and the rats' withdrawal threshold to a mechanical stimulus was measured using von Frey filaments of 10 increasing force (2.6 – 167 mN) applied to the plantar surface of the paw using an up and down method (Chaplan SR et al., *J Neurosci. Methods* **53**: 55-63, 1994; Dixon J *Ann. Rev. Pharmacol. Toxicol.* **20**: 441-462, 1980). Following baseline measurements each animal was anaesthetised and the L5 spinal nerve tightly ligated. The animals were allowed to recover from the surgery for a period of at least seven days. On the day of drug administration the 15 paw withdrawal thresholds were re-measured (0 min). Immediately after this reading, the rats were dosed orally with vehicle or test compound. Readings were then made at 60, 120, 180 and 240 min after compound administration.

Data were expressed as mean  $\pm$  s.e.m. The time of maximum effect for each animal in the top dose group was determined and these values averaged to calculate the mean time of 20 maximum effect. For analytical purposes the time of maximum effect,  $t_{max}$  was defined as the time point closest to this averaged value. Data at  $t_{max}$  were compared between groups using the Kruskal-Wallis one-way analysis of variance, a non-parametric statistical test. Each of the treatment groups were then compared against the vehicle group, using the non-parametric Dunn's test. The ED<sub>50</sub> (dose at which allodynia is reversed by approximately 50%) value was 25 also calculated at  $t_{max}$  using non linear regression (sigmoidal dose response; variable slope) with constants of 0 and 15g (cut-off) for the bottom and top, respectively (XLFit software).
